

Securit 3400 Software

Entry level ID card software for small organisations

Securit 3400 is the perfect solution for cost effective card personalisation. This is the perfect, entry level package for the low volume user. Up to 100 records can be stored in a single database, together with 2 card layouts. More than one database can be created. Securit 3400 software enables card design and card personalisation on demand. You are in control of the complete card issuing process. Your template layout can include any graphics, logos, pictures and both static and dynamic text (name, number expiry date etc.), limited only by your imagination. Add the required personal data (name ID number etc.) and capture the person's photo. This can be done with a webcam or any digital camera. Securit 3400 also offers barcode and magstripe encoding to ensure your cards can be compatible with other systems (access control, time & attendance...)

FEATURES

- Single user
- Limited to 100 records per database
- 2 layouts
- Single sided printing
